

Efficient Renaming in Conflict-Free Replicated Data Types (CRDTs)

Case Study of a Sequence CRDT : LogootSplit

Matthieu Nicolas (matthieu.nicolas@inria.fr), Gérald Oster, Olivier Perrin

CRDTs [2]

- Replicated data structure
- Updates performed without coordination
- **Strong Eventual Consistency** [2]

Limits

- Attach an identifier to each element
- **Size of identifiers not bounded**
- **Overhead of the data structure increasing over time**

INSERER GRAPHE ICI

l'évolution de la taille des éléments et du CRDT en fonction du nombre d'éléments insérés

How to reduce the overhead introduced by the data structure ?

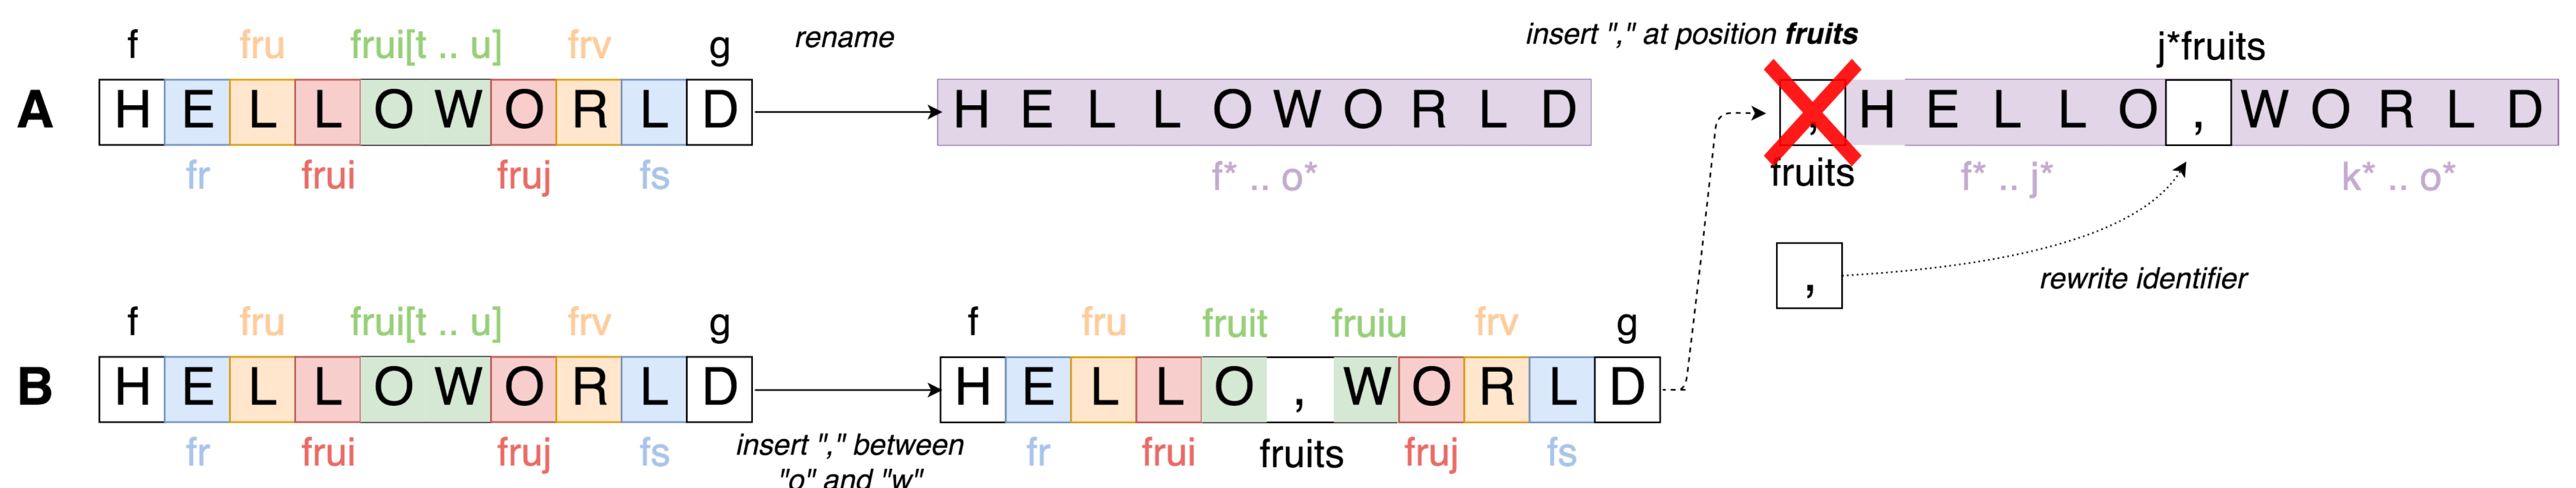

Reassign shorter identifiers in a fully distributed manner

Rename operation

- Introduce a *rename* operation
- Reassign shorter identifiers to whole current state

Rewriting rules

- Concurrent *insert* or *delete* can not be applied as such
- Define rewriting rules for concurrent updates

Concurrent *rename* operations

- Concurrent *rename* operations are a special case
- Define a total order on *rename* operations
- Pick a “winner” operation between concurrent *renames*
- Add rewriting rules to *undo* effects of “losing” ones

Propose a fully distributed renaming mechanism for LogootSplit [1]

- Designed a *rename* operation
- Defined rewriting rules to deal with concurrent updates
- WIP: Implementation in MUTE (<https://coedit.re/>)
- WIP: Design the strategy to trigger the renaming
- Prove formally its correctness
- Benchmark its performances

Next Steps

- **Generalize the approach** to other CRDTs
 - À COMPLÉTER
